

CMX Snow Climatology - April

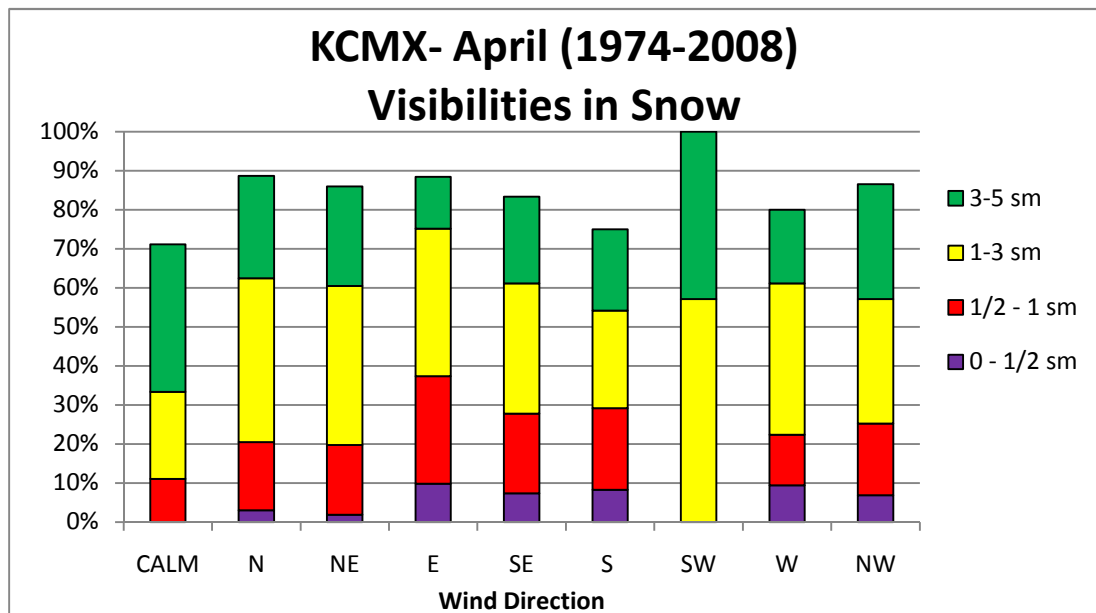

Majority of observations with snow occurred with NW, N and E winds.

Ceilings:

Predominant ceiling much more variable than most of winter but from most wind directions MVFR (1000 - 3000 ft) is highest percentage. Exception is with NW winds (IFR the most observed) or with E winds (LIFR the most observed).

E winds show much higher signal than any other wind direction to experience LIFR ceilings.

Visibilities:

Majority of visibilities IFR (1 - 3 miles).

Highest percentage of VLIFR (0 to 1/2 mile) visibilities occurred with an E or NW wind.

KCMX- Hourly Observations with Snow April (1974-2008)
